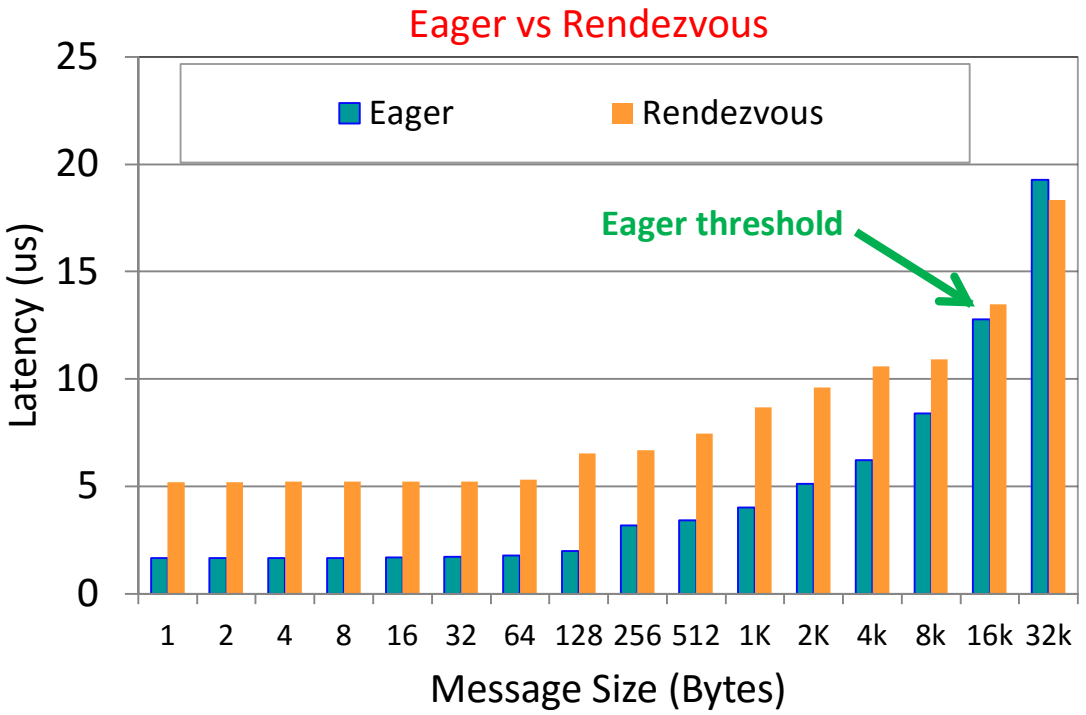
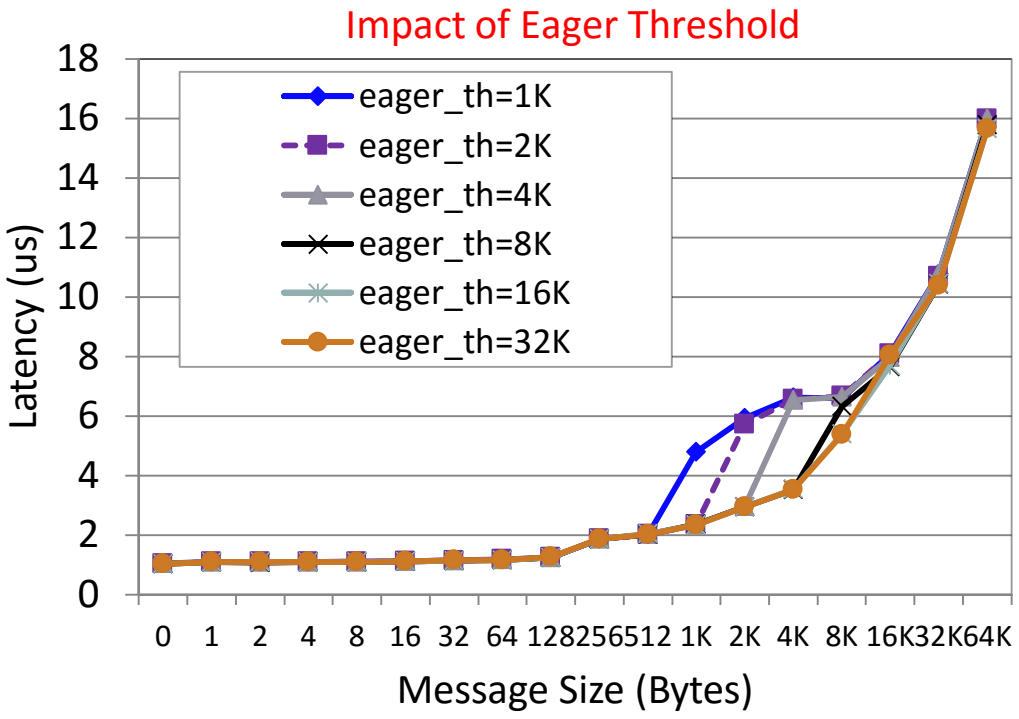
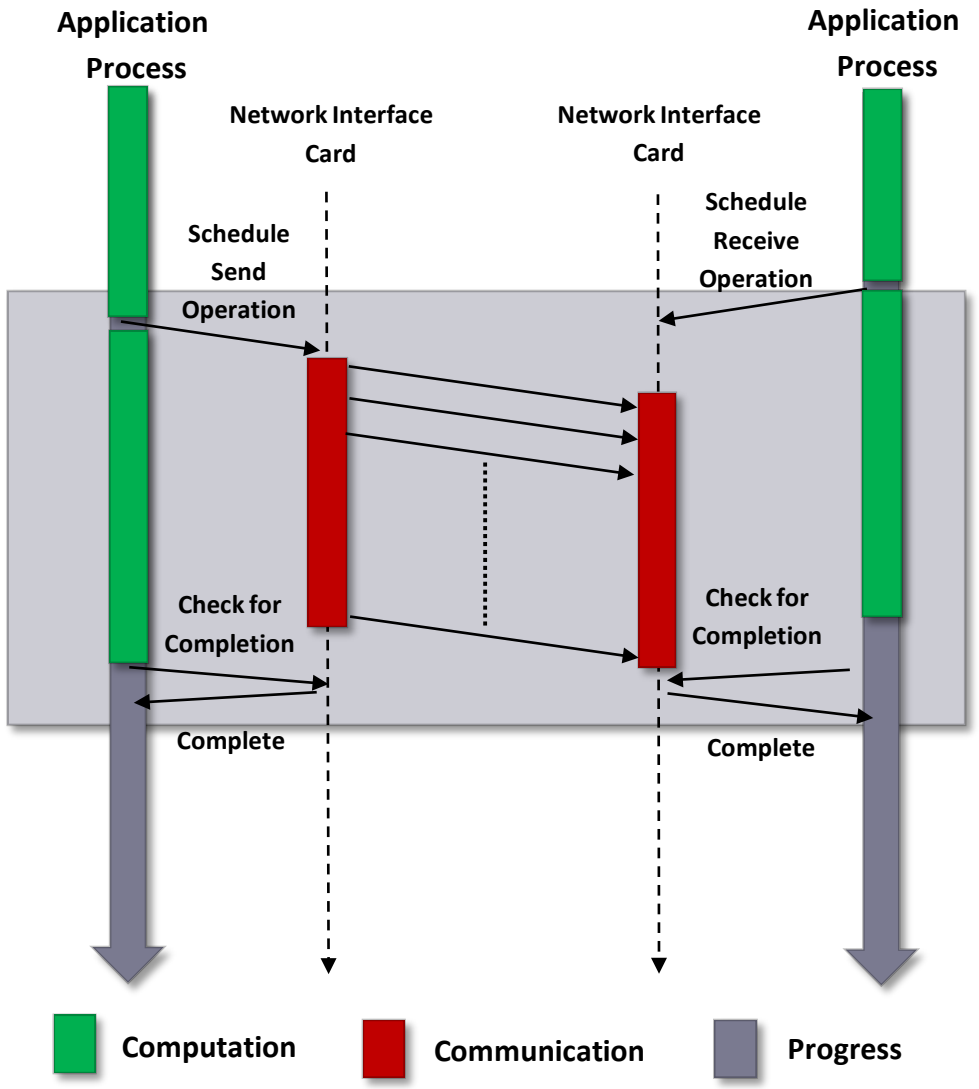
Inter-node Point-to-Point Tuning: Eager Thresholds



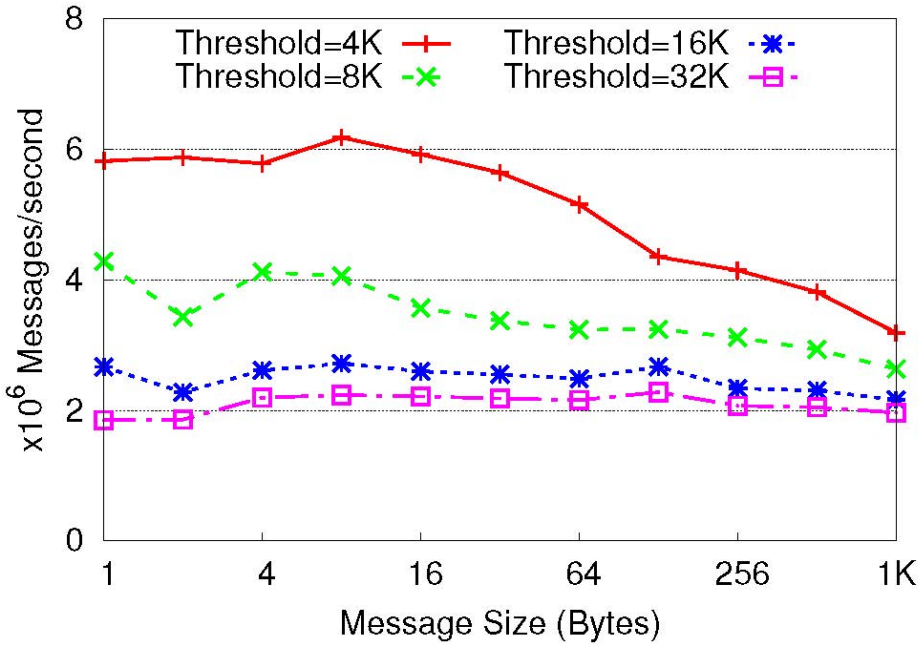


- Switching Eager to Rendezvous transfer
  - Default: Architecture dependent on common platforms, in order to achieve both best performance and memory footprint
- Threshold can be modified by users to get smooth performance across message sizes
  - mpirun_rsh –np 2 –hostfile hostfile MV2_IBA_EAGER_THRESHOLD=32K a.out
  - Memory footprint can increase along with eager threshold

Analyzing Overlap Potential of Eager Protocol

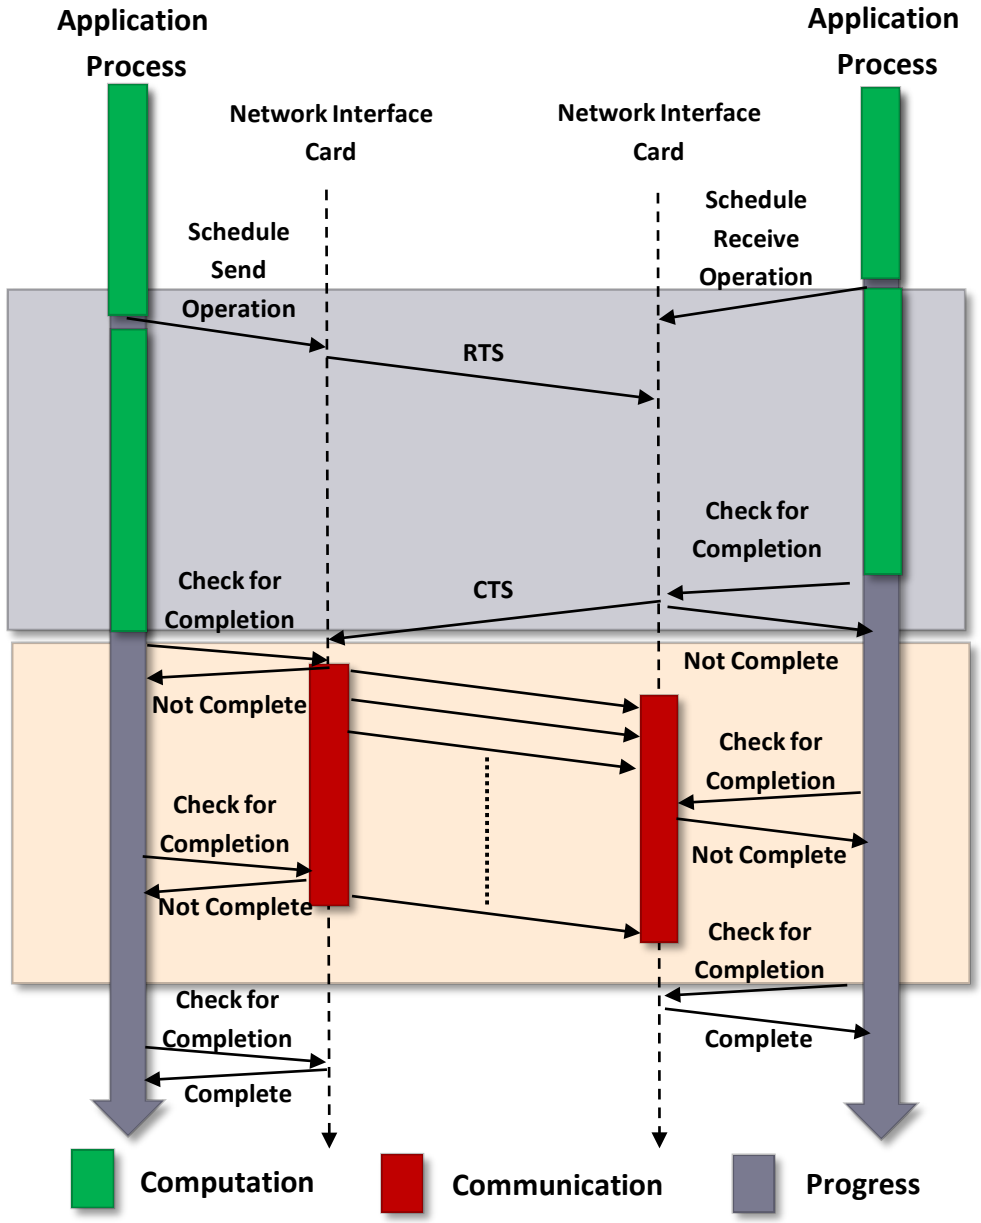


- Application processes schedule communication operation
- Network adapter progresses communication in the background
- Application process free to perform useful compute in the foreground
- **Overlap of computation and communication => Better Overall Application Performance**
- **Increased buffer requirement**
- **Poor communication performance if used for all types of communication operations**



Impact of changing Eager Threshold on performance of multi-pair message-rate benchmark with 32 processes on Stampede

Analyzing Overlap Potential of Rendezvous Protocol



- Application processes schedule communication operation
- Application process free to perform useful compute in the foreground
- Little communication progress in the background
- All communication takes place at final synchronization

- **Reduced buffer requirement**
- **Good communication performance if used for large message sizes and operations where communication library is progressed frequently**

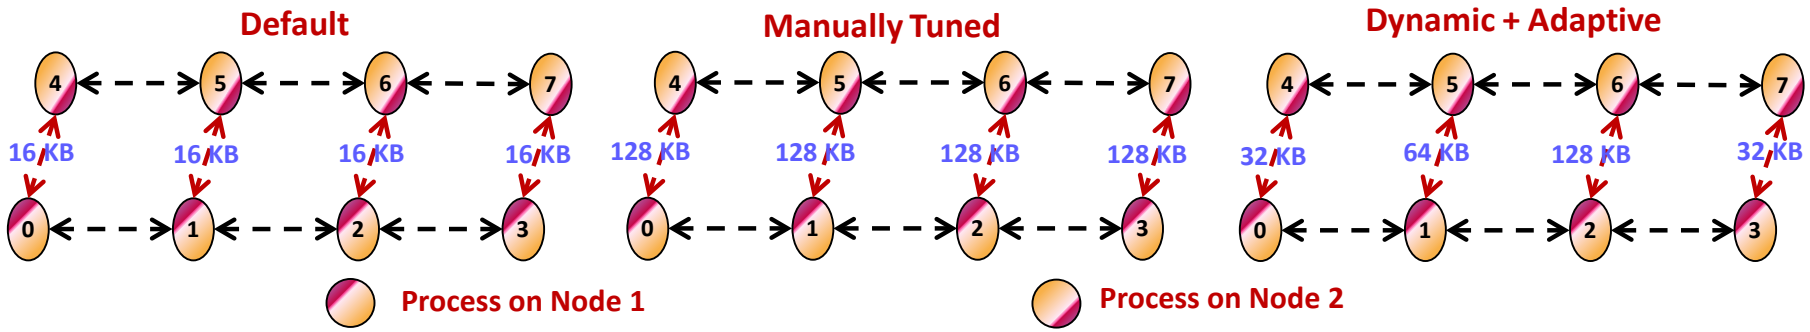
- **Poor overlap of computation and communication => Poor Overall Application Performance**

Dynamic and Adaptive MPI Point-to-point Communication Protocols

Desired Eager Threshold

Process Pair	Eager Threshold (KB)
0 – 4	32
1 – 5	64
2 – 6	128
3 – 7	32

Eager Threshold for Example Communication Pattern with Different Designs



Design	Metrics: Overlap & Memory Requirement	Metrics: Performance & Productivity

Dynamic and Adaptive Tag Matching

Challenge

Tag matching is a significant overhead for receivers

Existing Solutions are

- Static and do not adapt dynamically to communication pattern
- Do not consider memory overhead

Solution

A new tag matching design

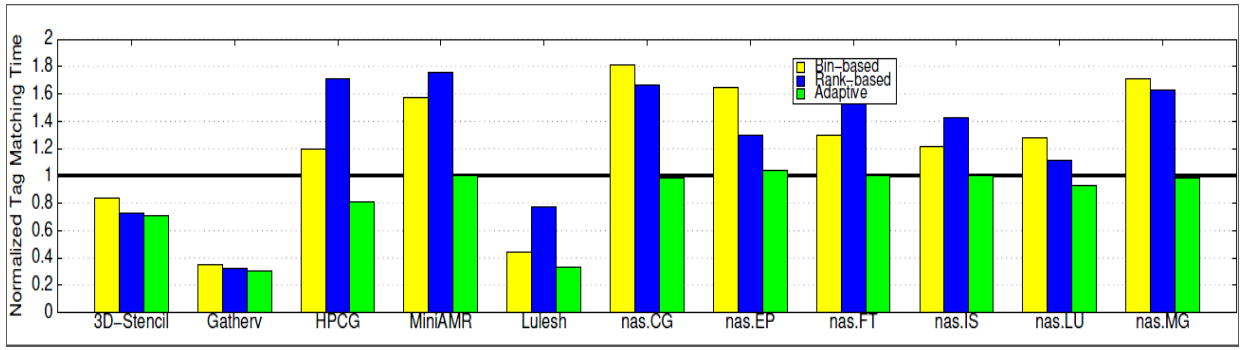
- Dynamically adapt to communication patterns
- Use different strategies for different ranks
- Decisions are based on the number of request object that must be traversed before hitting on the required one

Results

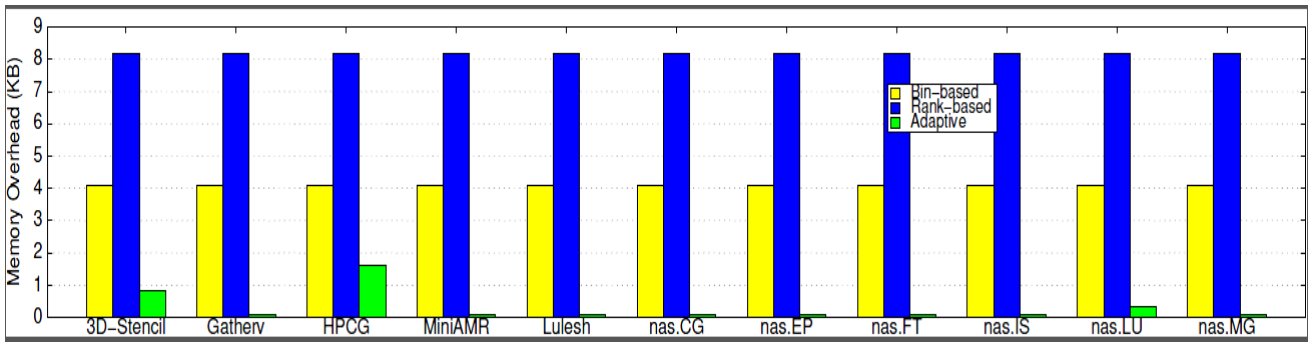
Better performance than other state-of-the art tag-matching schemes

Minimum memory consumption

Will be available in future MVAPICH2 releases



Normalized Total Tag Matching Time at 512 Processes
Normalized to Default (Lower is Better)



Normalized Memory Overhead per Process at 512 Processes

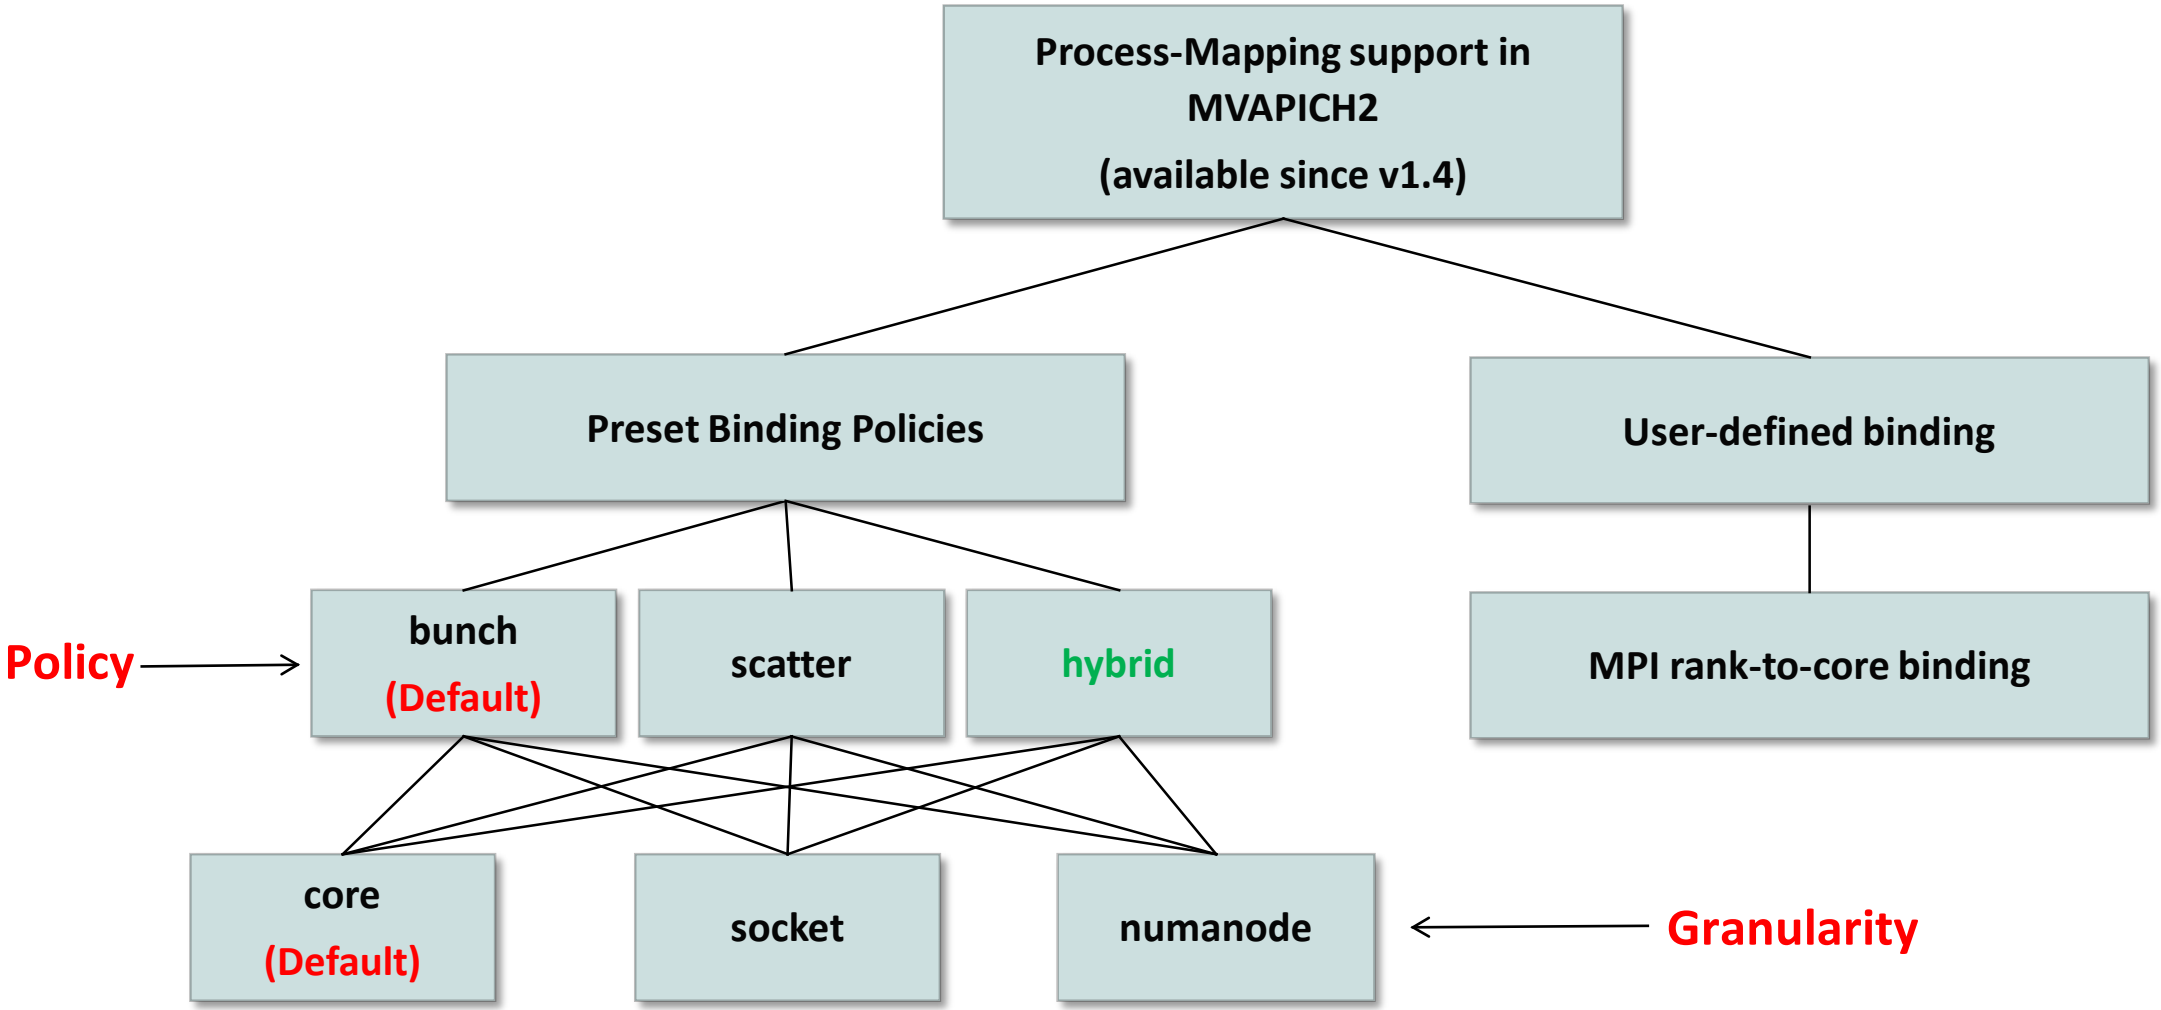
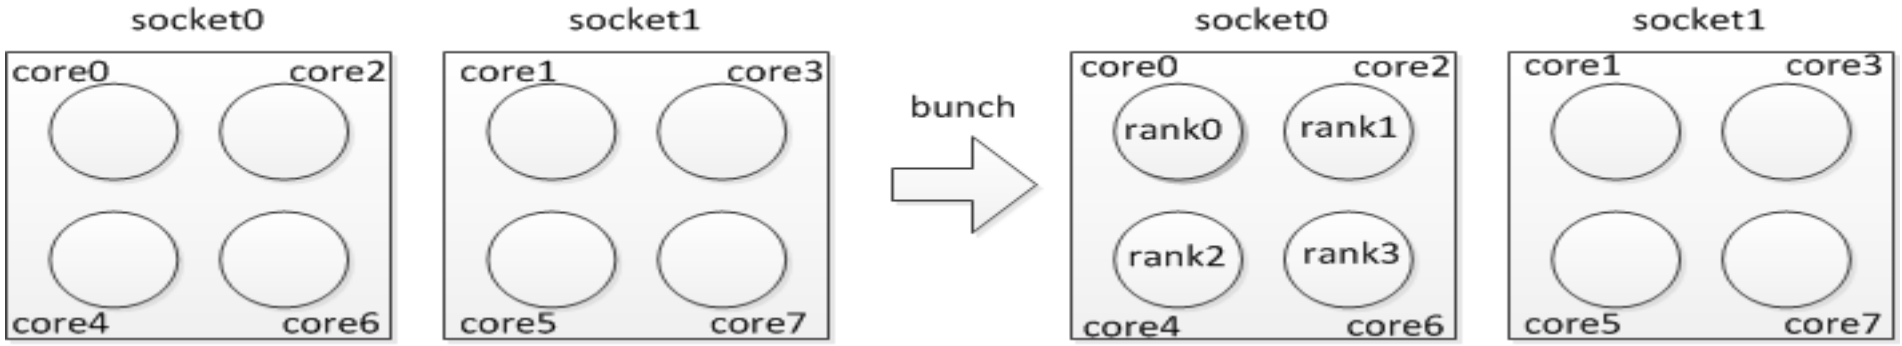
Process Mapping support in MVAPICH2



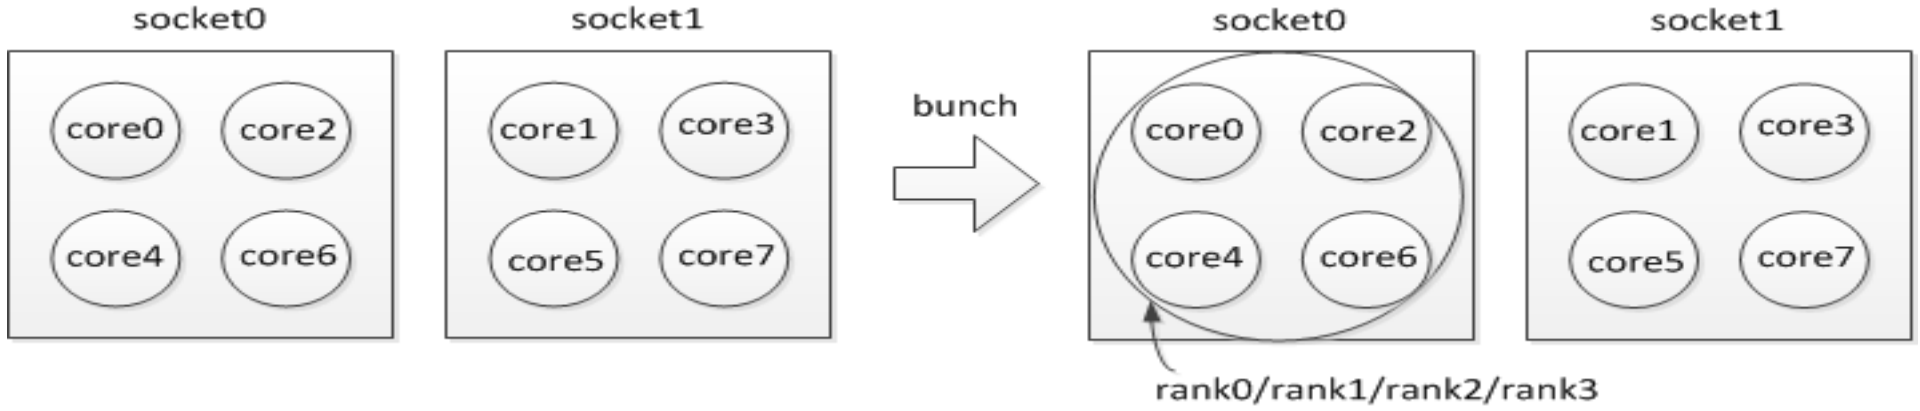
- MVAPICH2 detects processor architecture at job-launch

Preset Process-binding Policies – Bunch

- "Core" level "Bunch" mapping (Default)
  - MV2_CPU_BINDING_POLICY=bunch

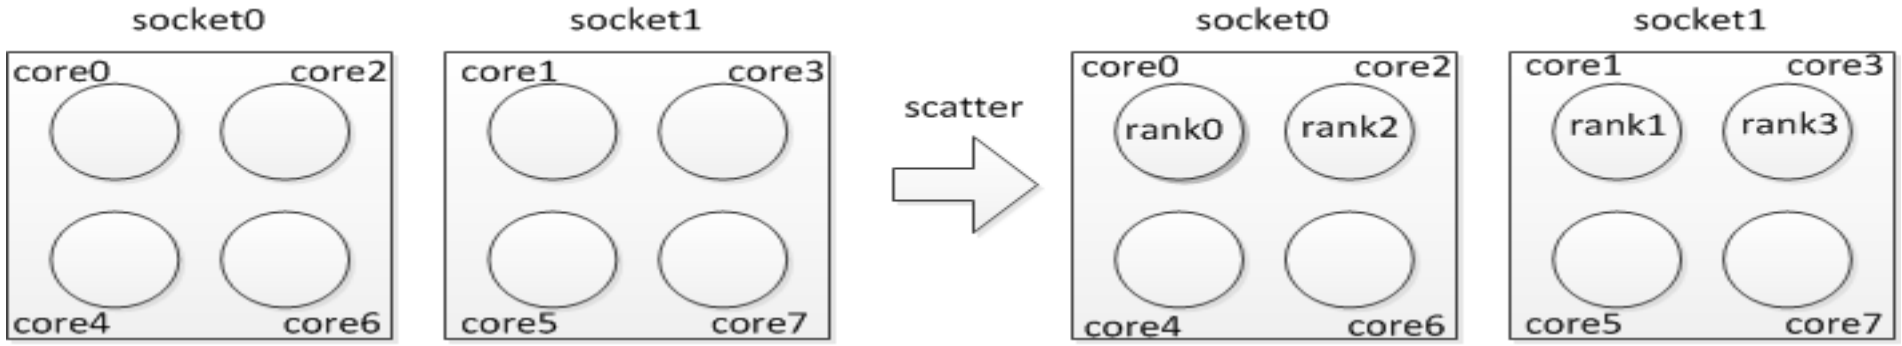


- "Socket/Numanode" level "Bunch" mapping
  - MV2_CPU_BINDING_LEVEL=socket MV2_CPU_BINDING_POLICY=bunch

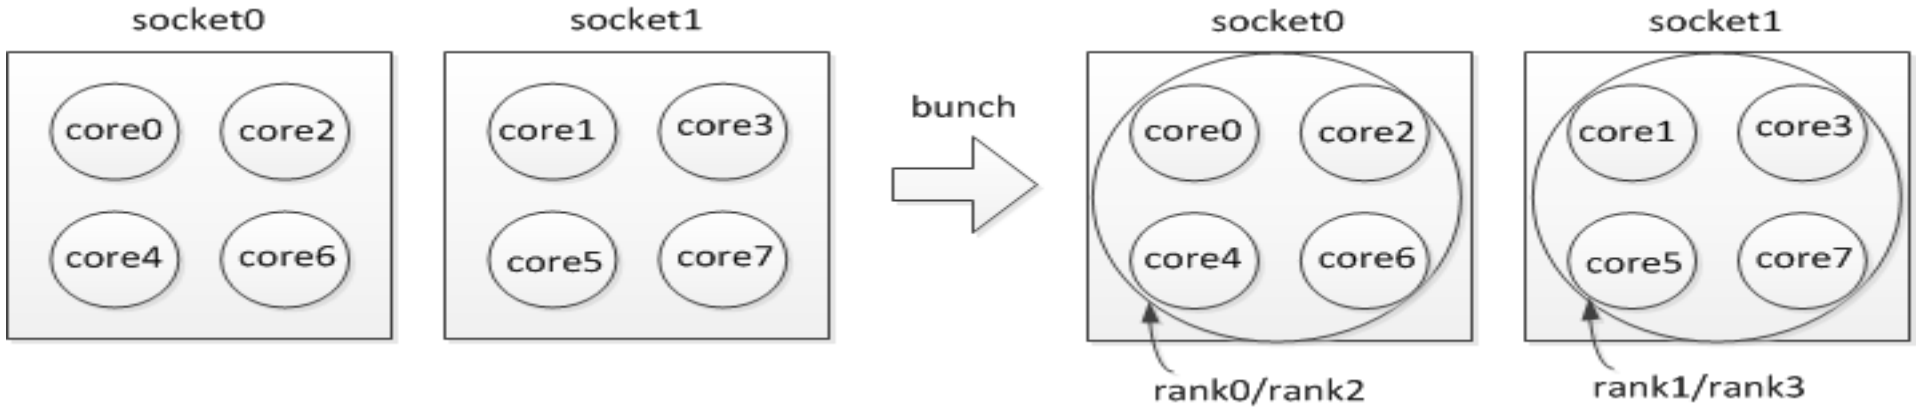


Preset Process-binding Policies – Scatter

- "Core" level "Scatter" mapping
  - MV2_CPU_BINDING_POLICY=scatter



- "Socket/Numanode" level "Scatter" mapping
  - MV2_CPU_BINDING_LEVEL=socket MV2_CPU_BINDING_POLICY=scatter

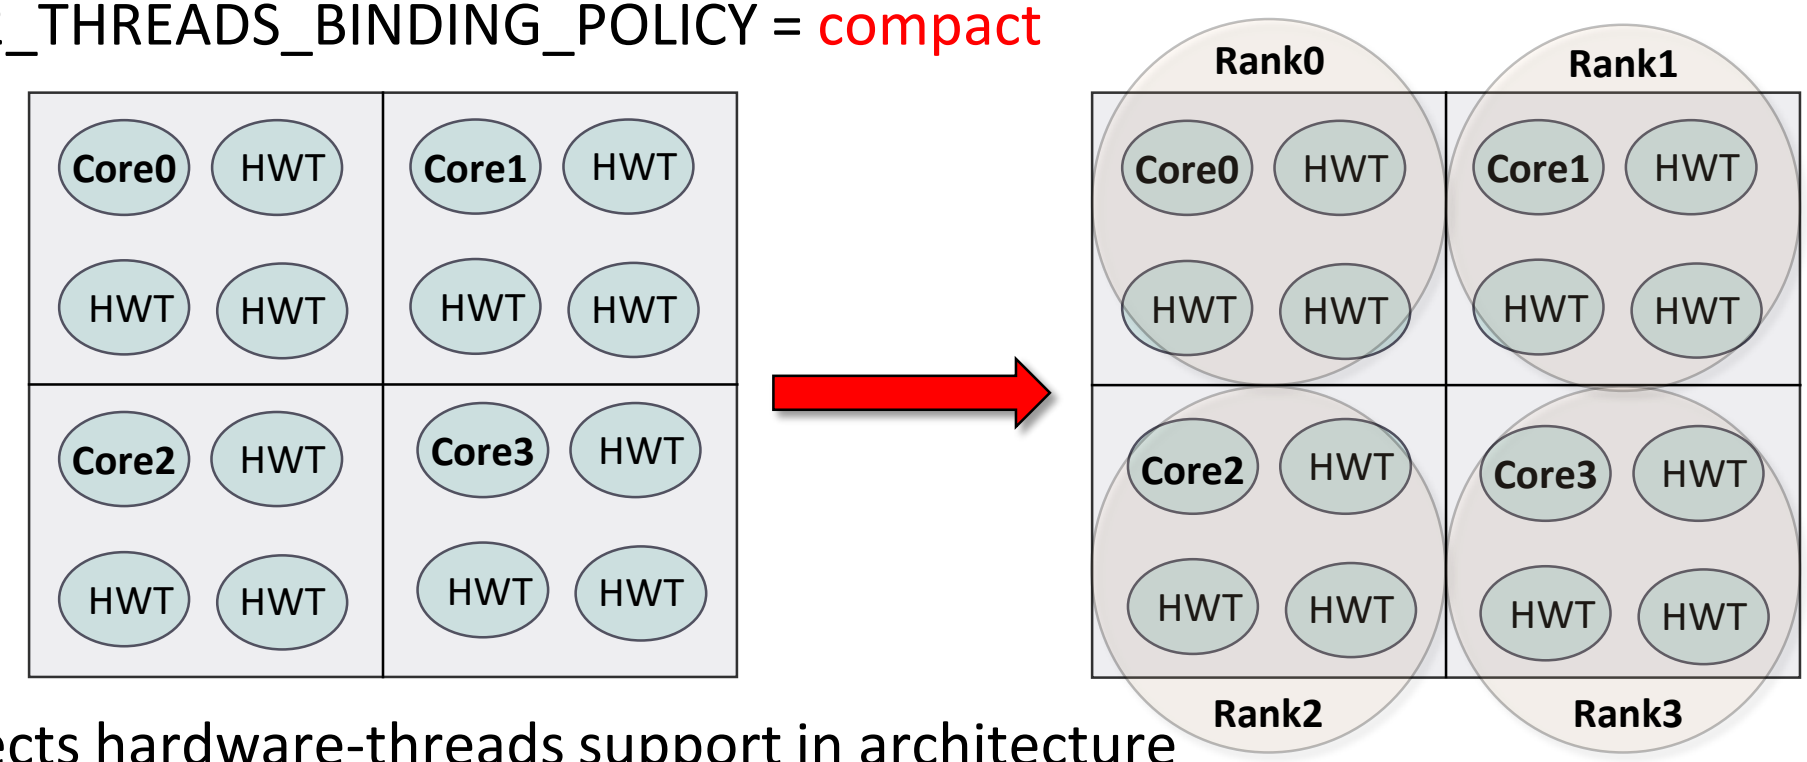


Process and thread binding policies in hybrid MPI+Threads

- A new process binding policy – "hybrid"
  - MV2_CPU_BINDING_POLICY = hybrid
- A new environment variable for co-locating Threads with MPI Processes
  - MV2_THREADS_PER_PROCESS = *k*
  - Automatically set to OMP_NUM_THREADS if OpenMP is being used
  - Provides a hint to the MPI runtime to spare resources for application threads.
- New variable for threads bindings with respect to parent process and architecture
  - MV2_THREADS_BINDING_POLICY = {linear | compact}
    - Linear – binds MPI ranks and OpenMP threads sequentially (one after the other)
      - Recommended to be used on non-hyper threaded systems with MPI+OpenMP
    - Compact – binds MPI rank to physical-core and locates respective OpenMP threads on hardware threads
      - Recommended to be used on multi-/many-cores e.g., KNL, POWER8, and hyper-threaded Xeon, etc.

Binding Example in Hybrid (MPI+Threads)

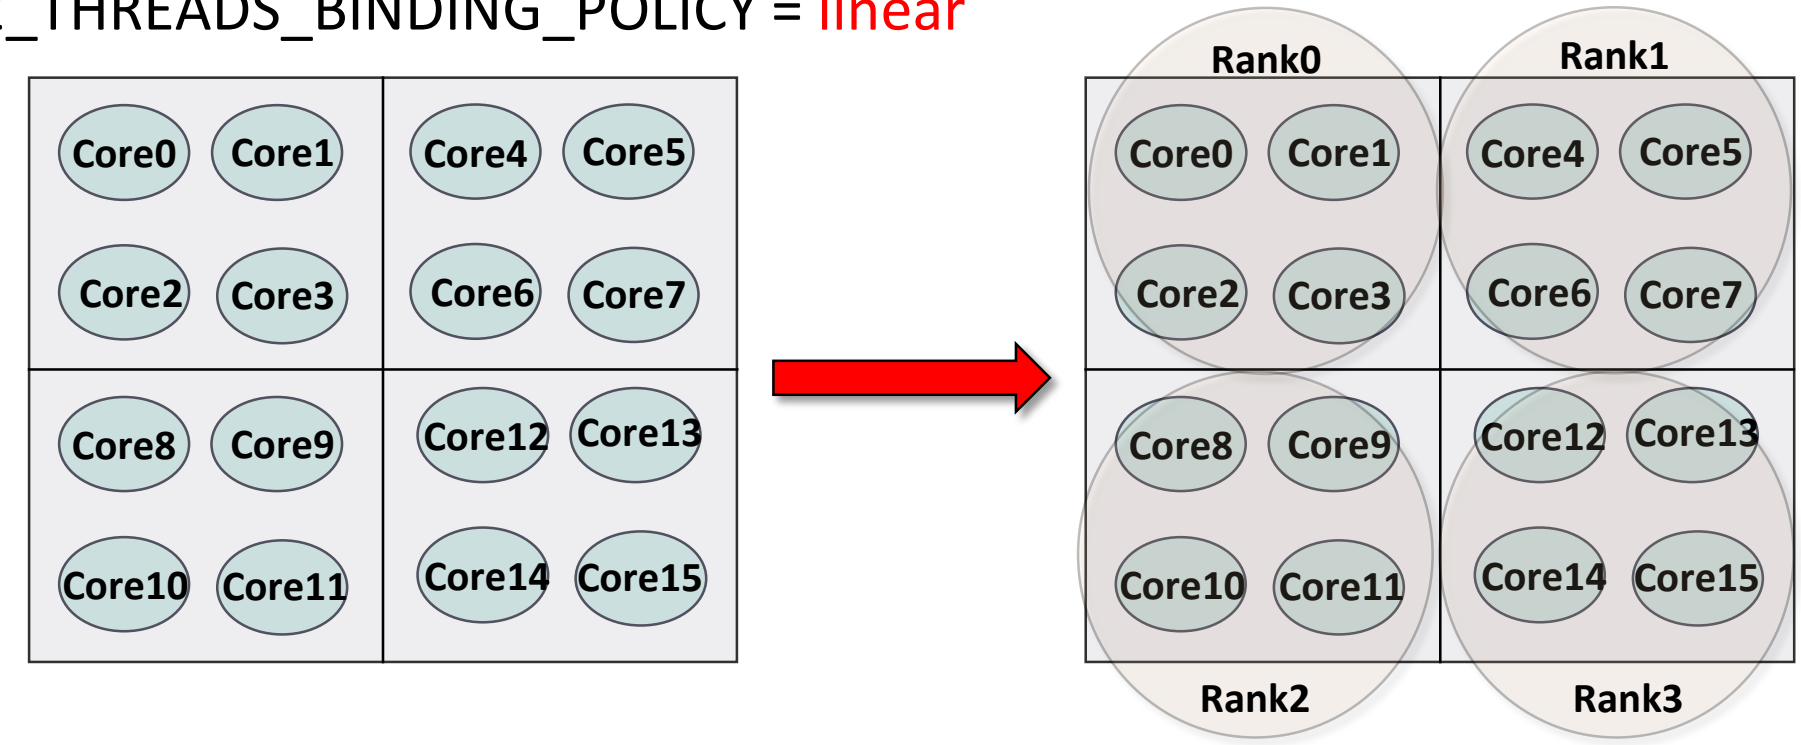
- MPI Processes = 4, OpenMP Threads per Process = 4
- MV2_CPU_BINDING_POLICY = hybrid
- MV2_THREADS_PER_PROCESS = 4
- MV2_THREADS_BINDING_POLICY = compact



- Detects hardware-threads support in architecture
- Assigns MPI ranks to physical cores and respective OpenMP Threads to HW threads

Binding Example in Hybrid (MPI+Threads) ---- Cont'd

- MPI Processes = 4, OpenMP Threads per Process = 4
- MV2_CPU_BINDING_POLICY = hybrid
- MV2_THREADS_PER_PROCESS = 4
- MV2_THREADS_BINDING_POLICY = linear



- MPI Rank-0 with its 4-OpenMP threads gets bound on Core-0 through Core-3, and so on

User-Defined Process Mapping

- User has complete-control over process-mapping
- To run 4 processes on cores 0, 1, 4, 5:
  - $ mpirun_rsh -np 4 -hostfile hosts MV2_CPU_MAPPING=0:1:4:5 ./a.out
- Use ',' or '-' to bind to a set of cores:
  - $mpirun_rsh -np 64 -hostfile hosts MV2_CPU_MAPPING=0,2-4:1:5:6 ./a.out
- Is process binding working as expected?
  - **MV2_SHOW_CPU_BINDING=1**
    - Display CPU binding information
    - Launcher independent
    - Example
      - MV2_SHOW_CPU_BINDING=1 MV2_CPU_BINDING_POLICY=scatter

```
-------------CPU AFFINITY-------------
        RANK:0  CPU_SET:   0
        RANK:1  CPU_SET:   8
```

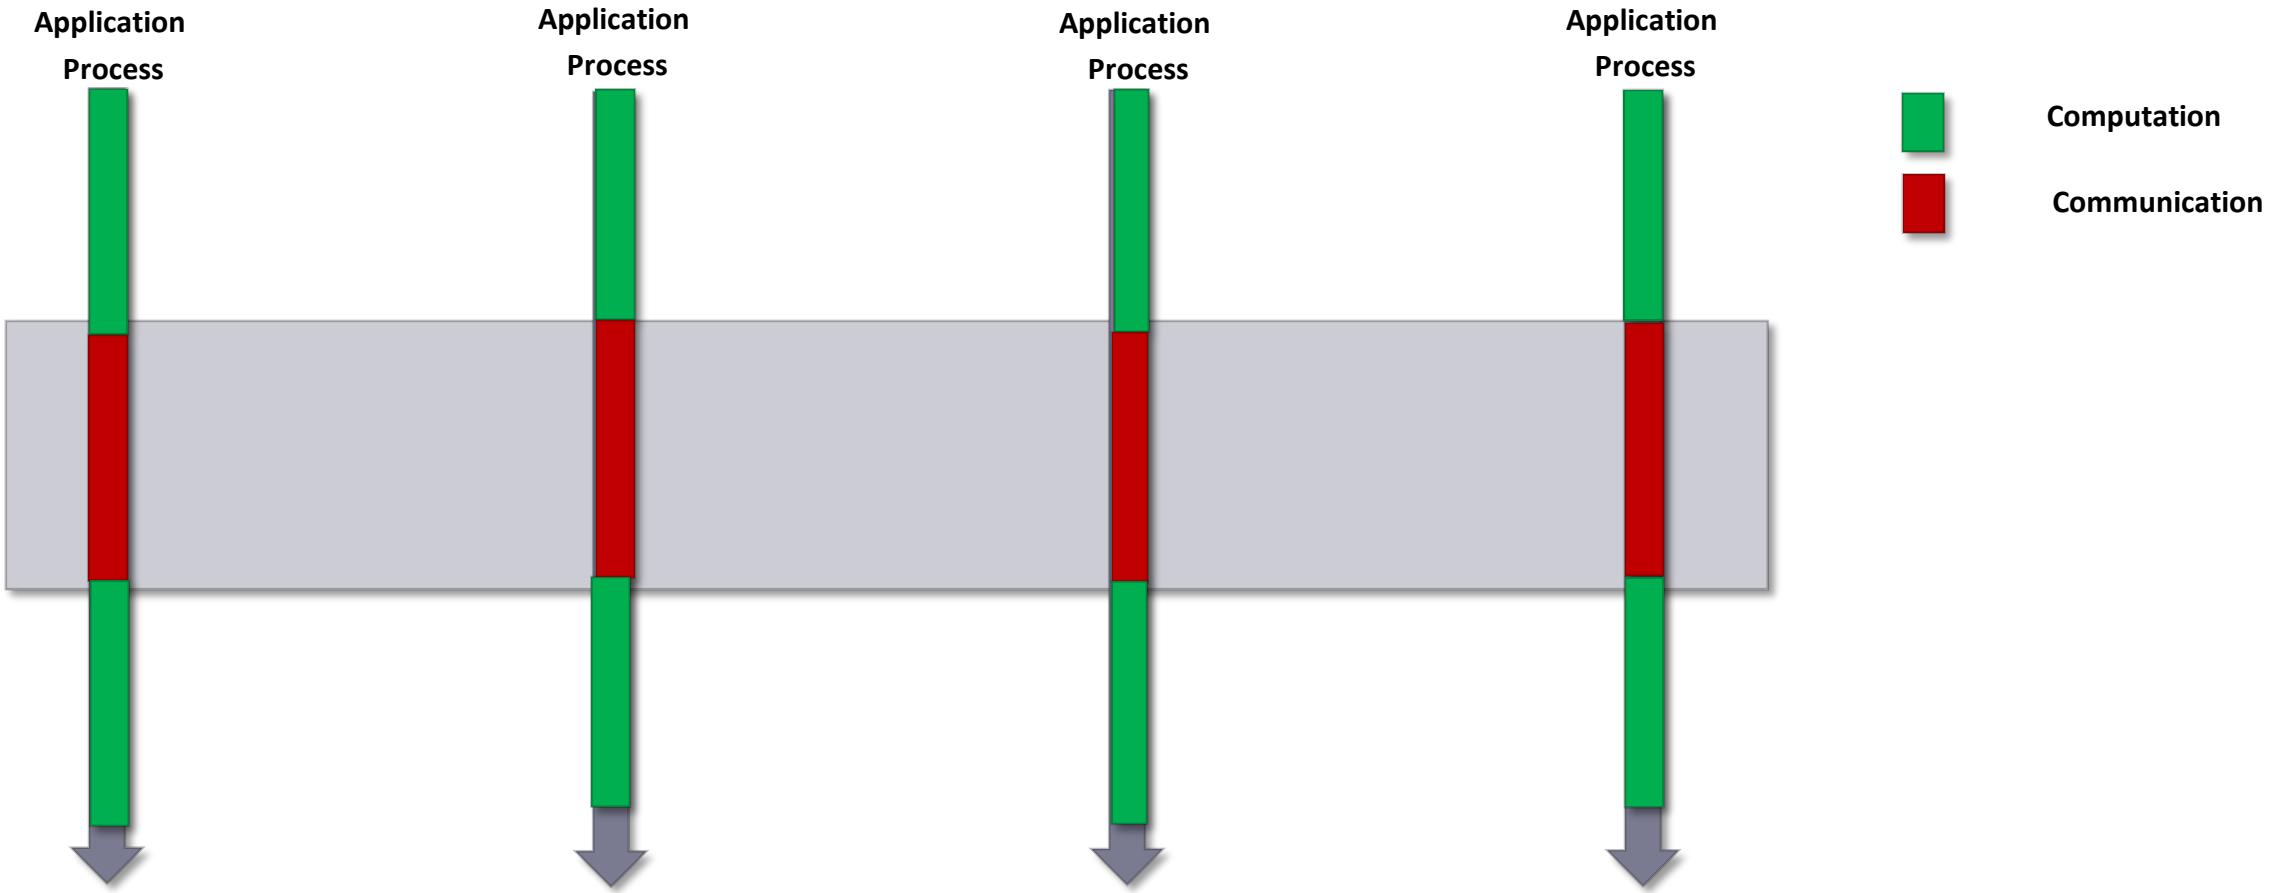
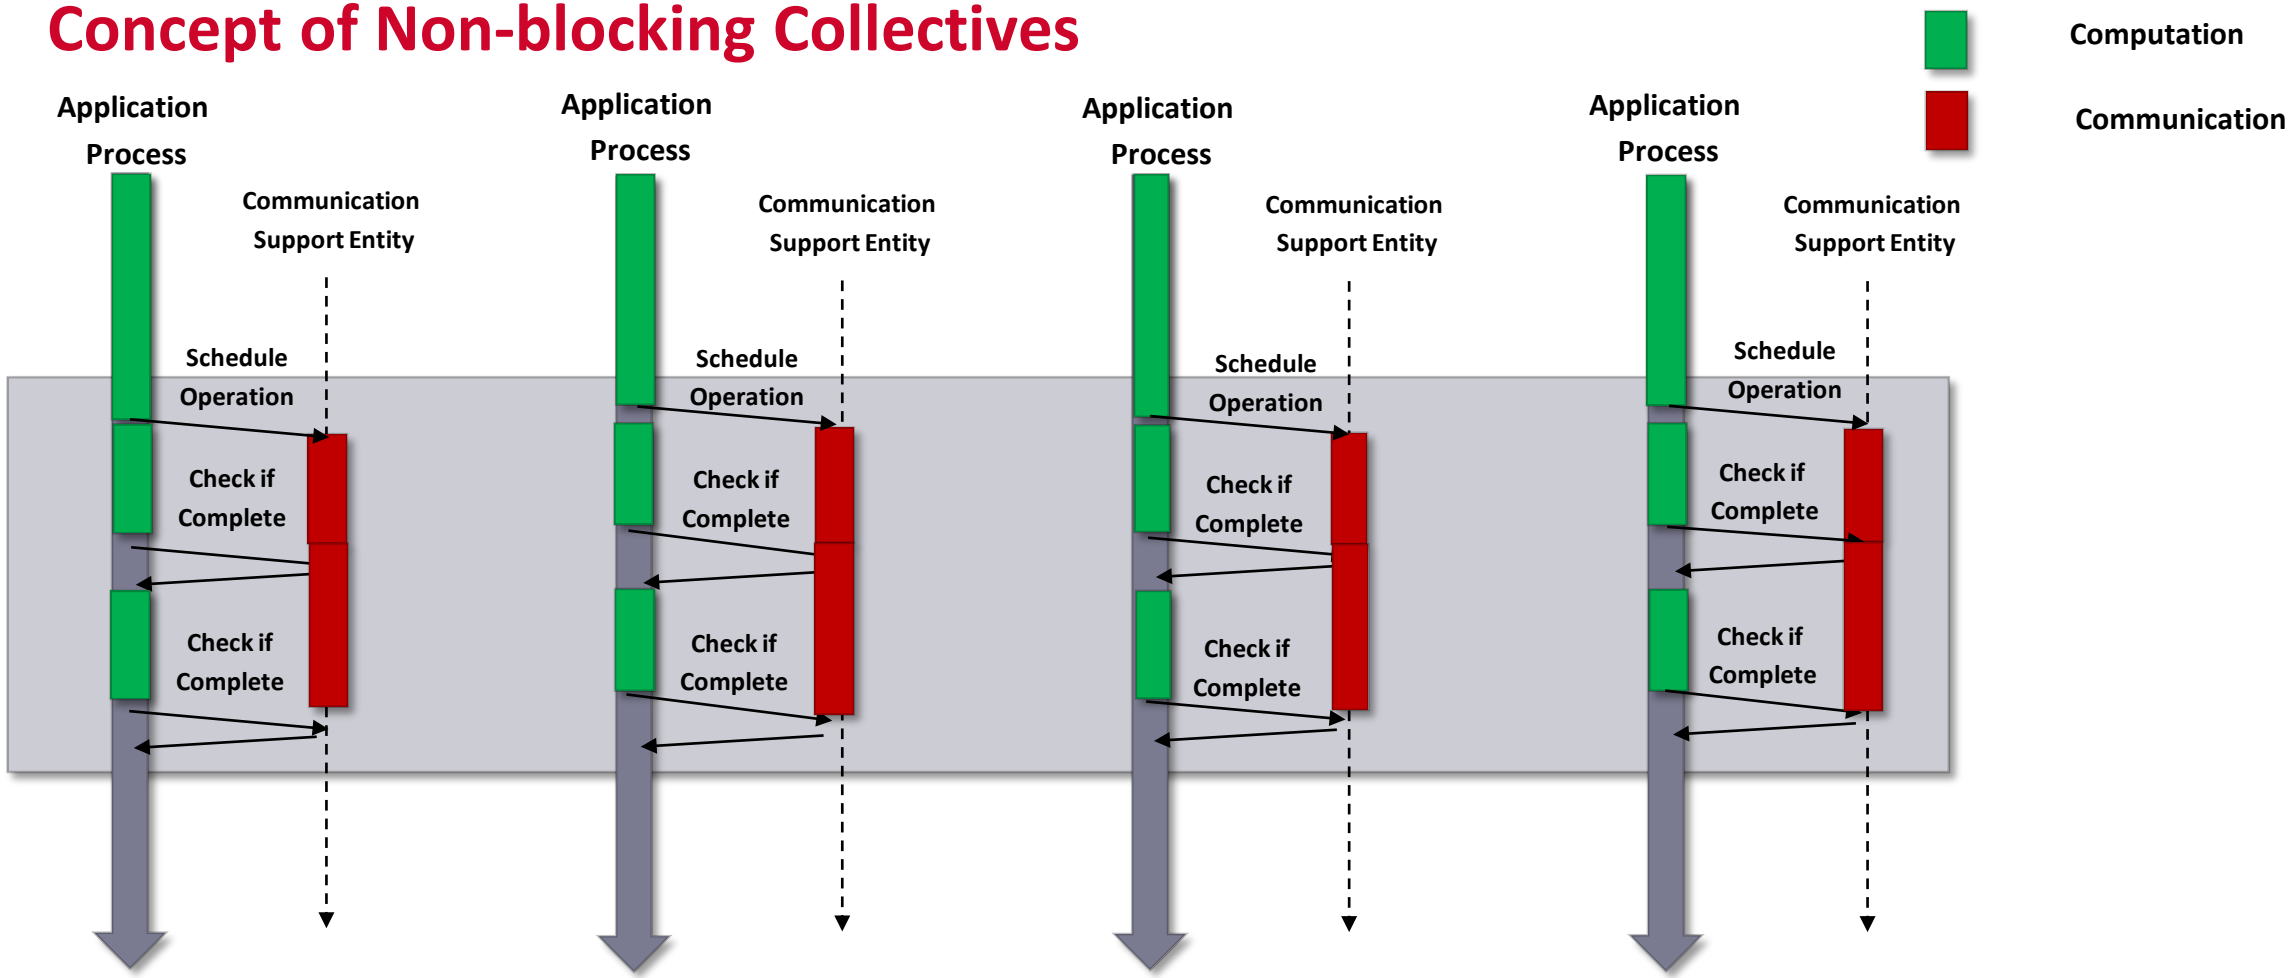
Problems with Blocking Collective Operations



- Communication time cannot be used for compute
  - No overlap of computation and communication
  - Inefficient

Concept of Non-blocking Collectives



- Application processes schedule collective operation
- Check periodically if operation is complete
- **Overlap of computation and communication => Better Performance**
- *Catch: Who will progress communication*

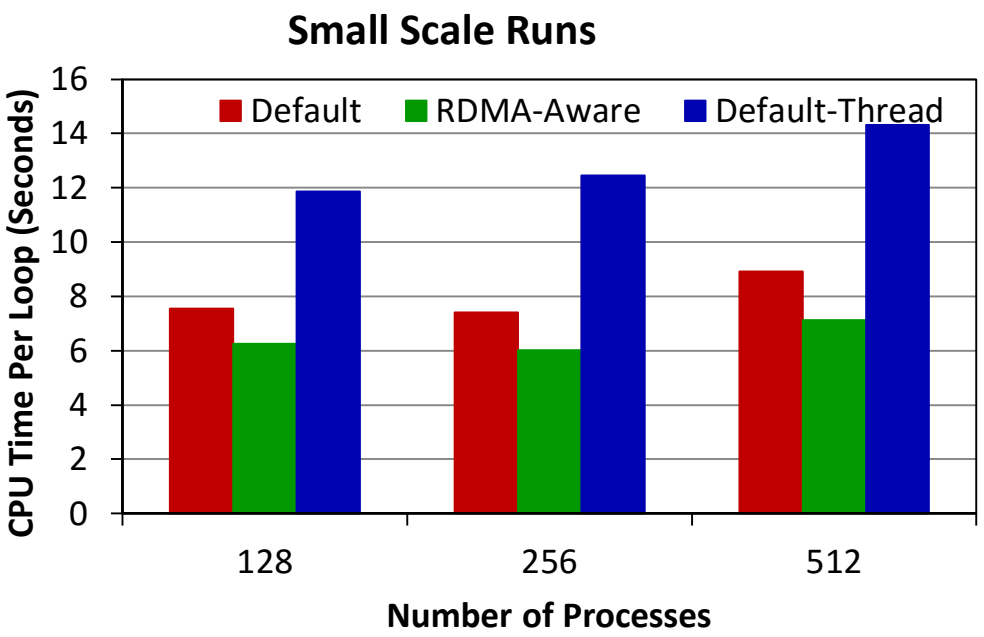
Non-blocking Collective (NBC) Operations

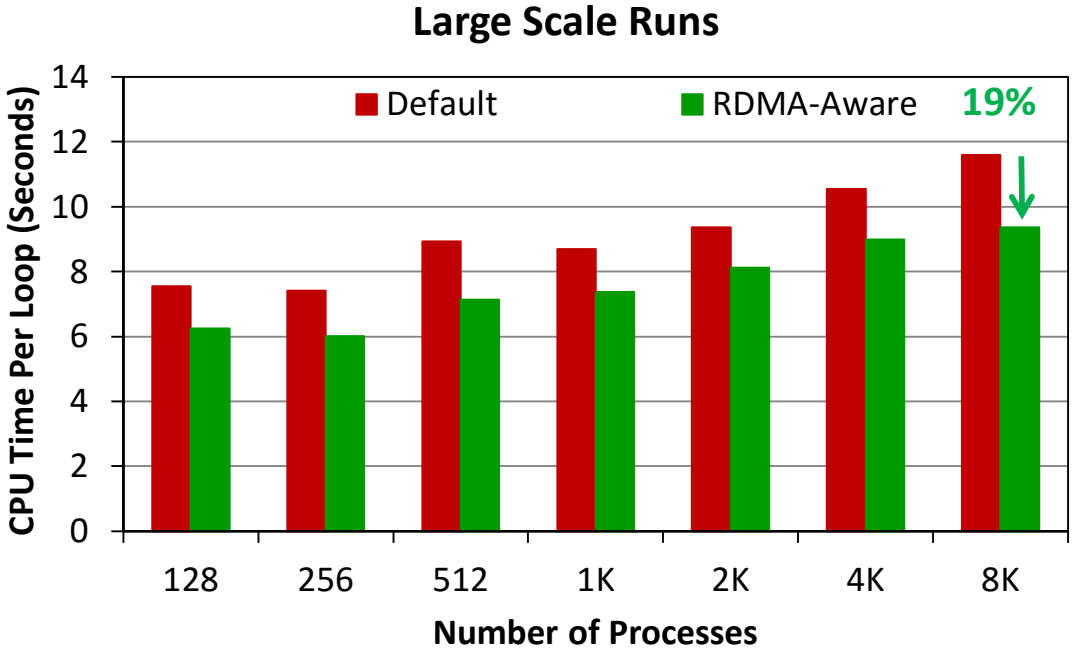
- Enables overlap of computation with communication
- Non-blocking calls do not match blocking collective calls
  - MPI may use different algorithms for blocking and non-blocking collectives
  - Blocking collectives: Optimized for latency
  - Non-blocking collectives: Optimized for overlap
- A process calling a NBC operation
  - Schedules collective operation and immediately returns
  - Executes application computation code
  - Waits for the end of the collective
- The communication progress by
  - Application code through MPI_Test
  - Network adapter (HCA) with hardware support
  - Dedicated processes / thread in MPI library
- There is a non-blocking equivalent for each blocking operation
  - Has an "I" in the name
    - MPI_Bcast -> MPI_Ibcast; MPI_Reduce -> MPI_Ireduce

How do I write applications with NBC?

```
void main()
{
    MPI_Init()
    …..
    MPI_Ialltoall(…)
    Computation that does not depend on result of Alltoall
    MPI_Test(for Ialltoall) /* Check if complete (non-blocking) */
    Computation that does not depend on result of Alltoall
    MPI_Wait(for Ialltoall) /* Wait till complete (Blocking) */
    …
    MPI_Finalize()
}
```

P3DFFT Performance with Non-Blocking Alltoall using RDMA Primitives





- Weak scaling experiments; problem size increases with job size
- RDMA-Aware delivers 19% improvement over Default @ 8,192 procs
- Default-Thread exhibits worst performance
  - Possibly because threads steal CPU cycles from P3DFFT
  - Do not consider for large scale experiments

Will be available in future

Offloading with Scalable Hierarchical Aggregation Protocol (SHArP)

- Management and execution of MPI operations in the network by using SHArP
  - Manipulation of data while it is being transferred in the switch network
- SHArP provides an abstraction to realize the reduction operation
  - Defines Aggregation Nodes (AN), Aggregation Tree, and Aggregation Groups
  - AN logic is implemented as an InfiniBand Target Channel Adapter (TCA) integrated into the switch ASIC *
  - Uses RC for communication between ANs and between AN and hosts in the Aggregation Tree *

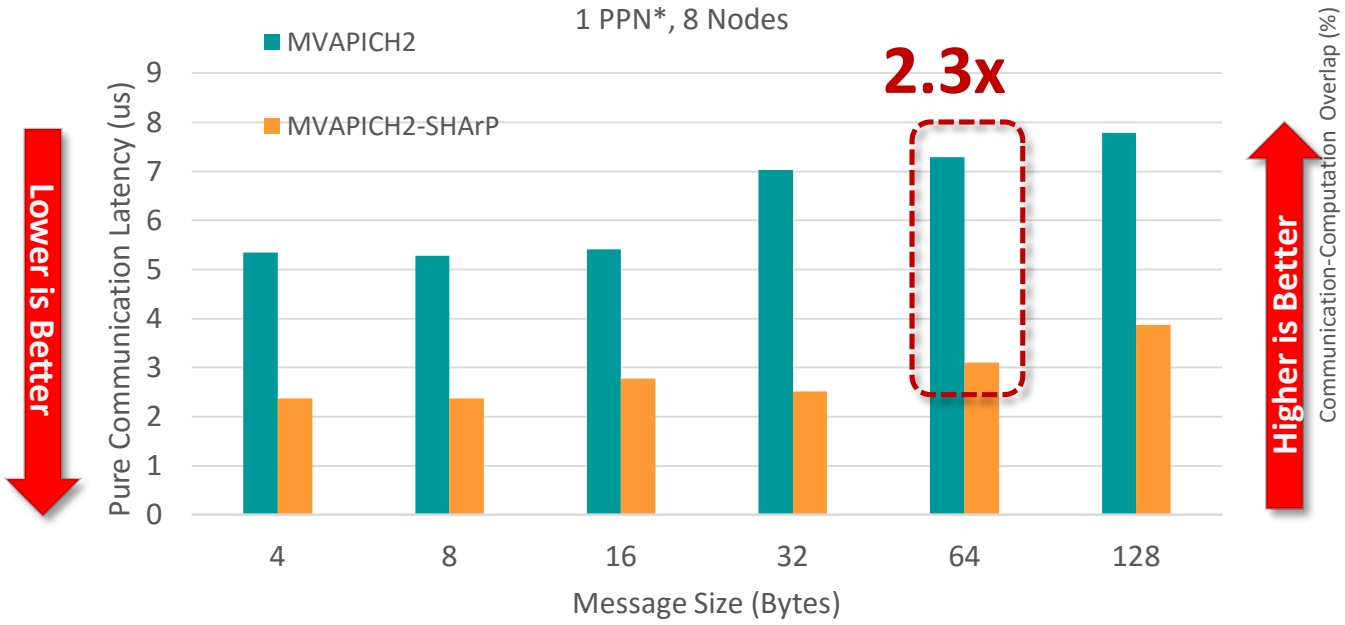
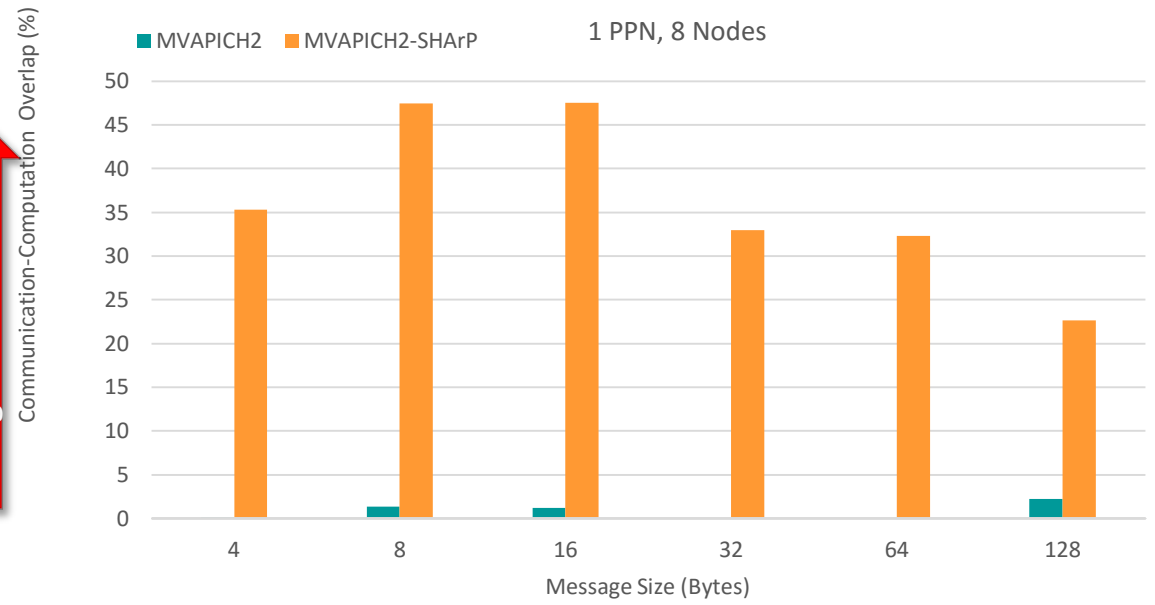
Evaluation of SHArP based Non Blocking Allreduce

MPI_Iallreduce Benchmark





- Complete offload of Allreduce collective operation to Switch helps to have much higher overlap of communication and computation

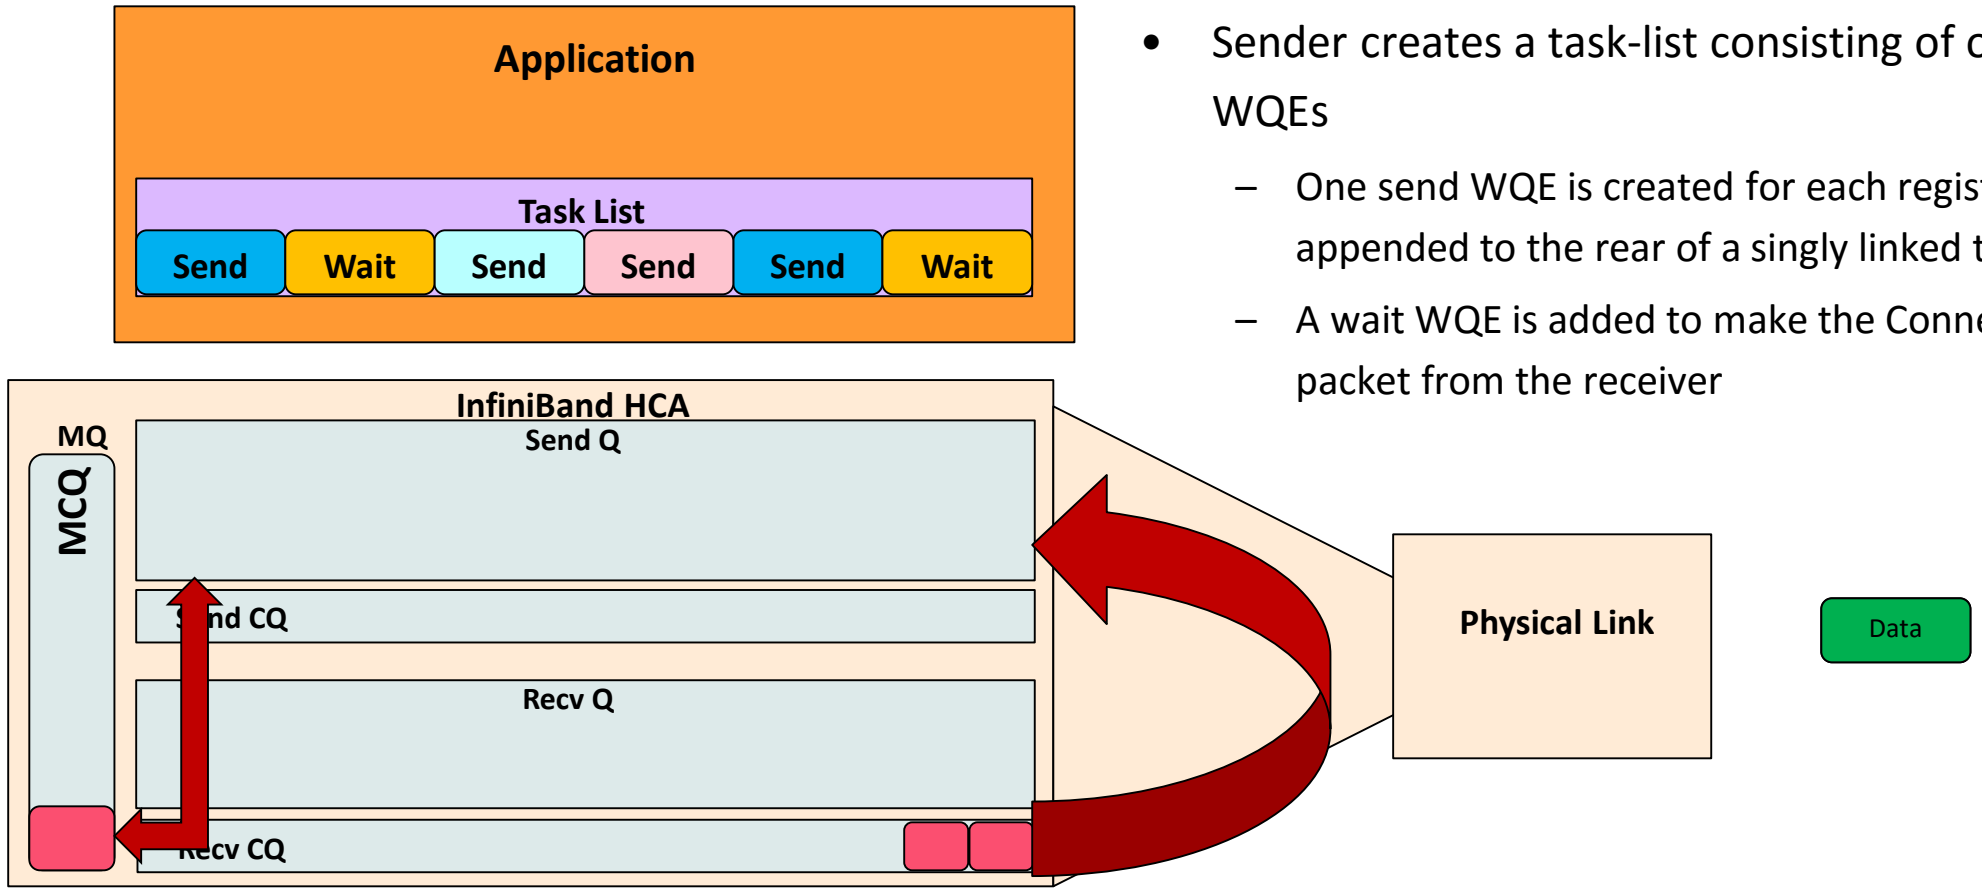
Available since MVAPICH2 2.3a

*PPN: Processes Per Node

Collective Offload in ConnectX-2, ConnectX-3, Connect-IB and ConnectX-4, ConnectX-5

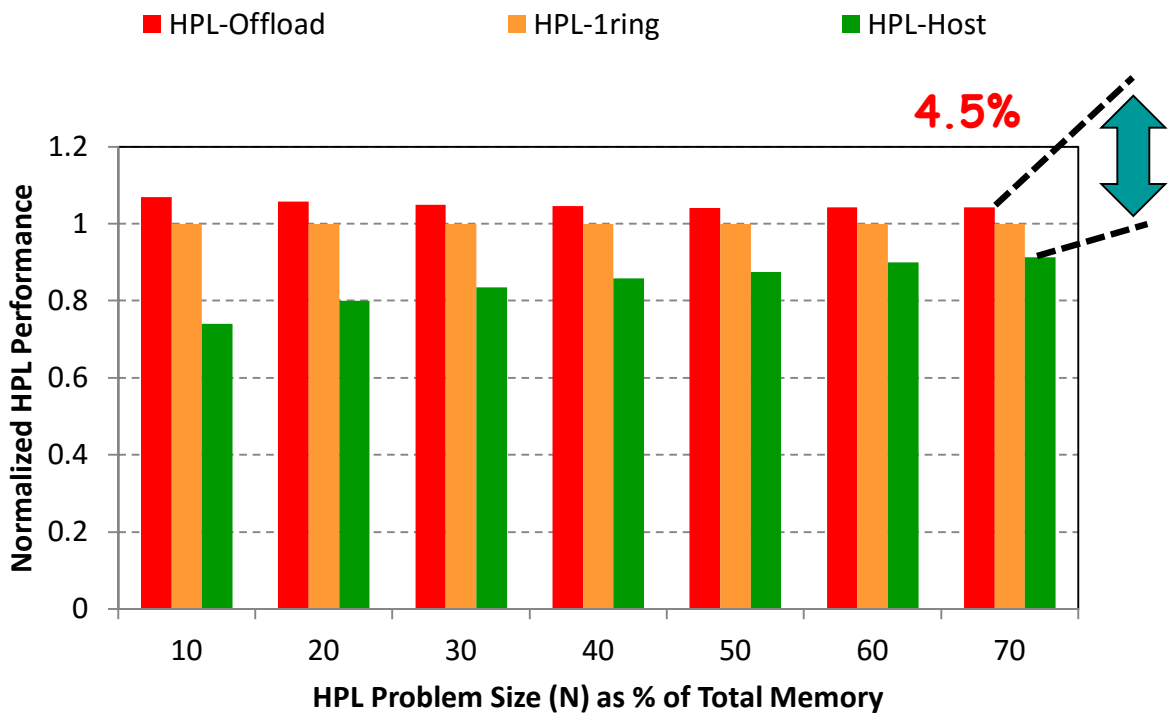
- Mellanox's ConnectX-2, ConnectX-3, ConnectIB, ConnectX-4, and ConnectX-5 adapters feature "task-list" offload interface
  - Extension to existing InfiniBand APIs
- Collective communication with `blocking' feature is usually a scaling bottleneck
  - Matches with the need for non-blocking collective in MPI
- Accordingly MPI software stacks need to be re-designed to leverage offload in a comprehensive manner
- Can applications be modified to take advantage of non-blocking collectives and what will be the benefits?

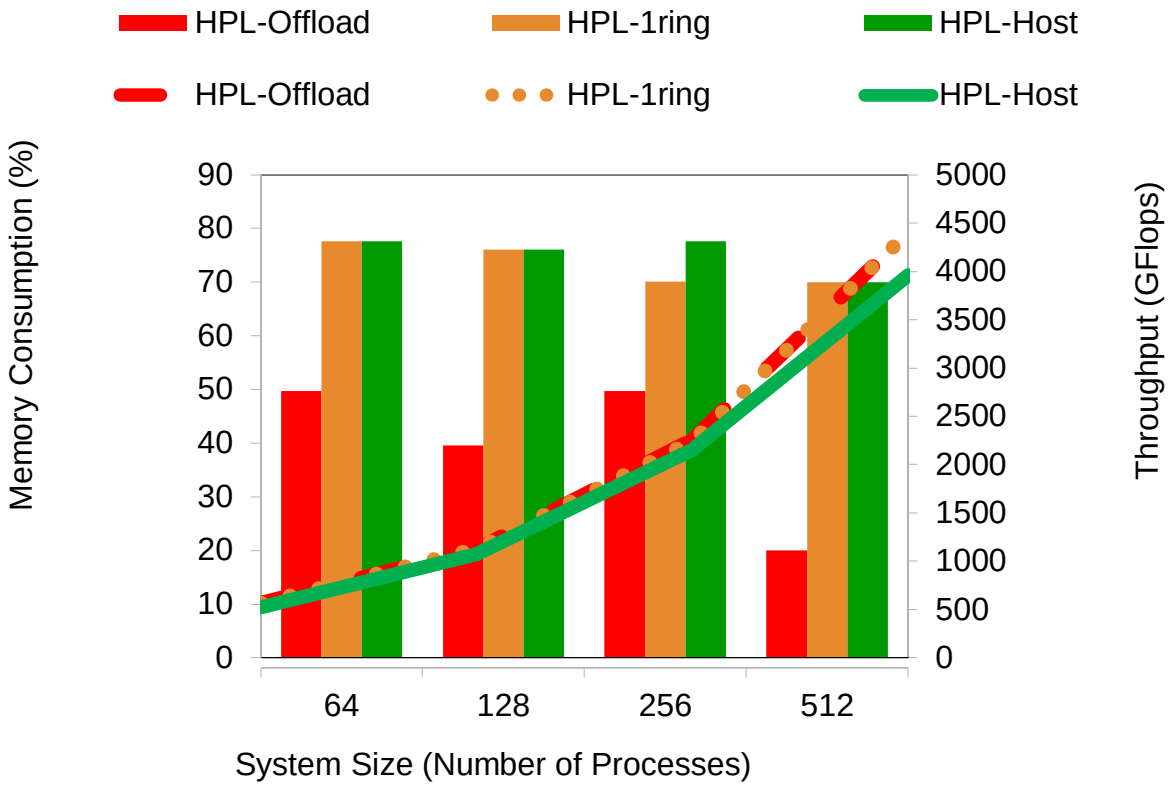
Collective Offload Support in ConnectX InfiniBand Adapter (Recv followed by Multi-Send)



- Sender creates a task-list consisting of only send and wait WQEs
  - One send WQE is created for each registered receiver and is appended to the rear of a singly linked task-list
  - A wait WQE is added to make the ConnectX-2 HCA wait for ACK packet from the receiver

Co-designing HPL with Core-Direct and Performance Benefits





Available in MVAPICH2-X

HPL Performance Comparison with 512 Processes

HPL-Offload consistently offers higher throughput than HPL-1ring and HPL-Host. Improves peak throughput by up to 4.5 % for large problem sizes

HPL-Offload surpasses the peak throughput of HPL-1ring with significantly smaller problem sizes and run-times!

Co-designing Applications to use MPI-T

Example Pseudo-code: Optimizing the eager limit dynamically:

```
MPI_T_init_thread(..)
MPI_T_cvar_get_info(MV2_EAGER_THRESHOLD)
if (msg_size < MV2_EAGER_THRESHOLD + 1KB)
    MPI_T_cvar_write(MV2_EAGER_THRESHOLD, +1024)
MPI_Send(..)
MPI_T_finalize(..)
```

- Can eager protocol be supported to improve performance for small messages?
- Two schemes proposed and used
  - Loopback (using network adapter to copy data)
  - Fastcopy/GDRCOPY (using CPU to copy data)
